IMPLEMENT CLIENT SCRIPT & UI POLICY (INCIDENT)

Phase 1: Brainstorming & Ideation Phase

1.1 Introduction

The **Implement Client Script & UI Policy (Incident)** project focuses on improving the accuracy and consistency of Incident records in ServiceNow. The project uses UI Policies and Client Scripts to control field behavior and validate user input.

1.2 Problem Identification

Manual data entry can result in incomplete or incorrect Incident information. Important fields may be left empty, incorrect values may be entered, or users may modify fields against business requirements. This can affect Incident management, reporting, SLA compliance, and service quality.

1.3 Project Idea

The project proposes implementing **UI Policies and Client Scripts** on the Incident table to:

- Make Assignment Group mandatory for High-impact Incidents.
- Make Urgency read-only when Impact is High.
- Automatically set Urgency to High.
- Prevent saving when Assigned To is missing.
- Prevent State changes through list editing.
- Allow valid updates through the Incident form.

1.4 Why This Idea Was Selected

This idea was selected because ServiceNow Incident Management requires accurate and consistent data. UI Policies and Client Scripts provide an effective way to enforce business rules directly on the Incident form while improving user interaction and data quality.

1.5 Expected Outcome

The expected outcome is a properly configured Incident form that automatically applies the required rules, validates user input, prevents incorrect submissions, and maintains consistent Incident data.
