PHASE 2: REQUIREMENT ANALYSIS PHASE

2.1 Introduction

The Requirement Analysis Phase identifies the functional and technical requirements for implementing **UI Policies and Client Scripts** on the ServiceNow Incident table. It defines the expected field behavior, validation rules, automation, and testing requirements.

2.2 Functional Requirements

The system should perform the following functions:

- Make **Assignment Group** mandatory when Impact is set to **High**.
- Make **Urgency** read-only when Impact is **High**.
- Automatically set **Urgency** to **High** when Impact changes to High.
- Prevent saving an Incident when **Assigned To** is empty for a High-impact Incident.
- Prevent users from changing **State** through direct list editing.
- Allow State changes through the normal Incident form.

2.3 Non-Functional Requirements

The system should meet the following requirements:

- Provide a simple and user-friendly Incident form.
- Display clear messages when validation fails.
- Apply the configured rules consistently.
- Improve the accuracy and consistency of Incident data.
- Keep the configuration simple and easy to maintain.
- Provide quick responses to user actions.

2.4 UI Policy Requirements

A UI Policy named **High Impact Control** should be created for the **Incident** table.

The UI Policy should:

- Be active.
- Apply when **Impact = 1 – High**.
- Make **Assignment Group** mandatory.
- Make **Urgency** read-only using a UI Policy Action.

- Enable **Reverse if False** to restore normal field behavior when the condition is no longer true.

2.5 Client Script Requirements

Three Client Scripts are required for the project:

- **onChange Client Script:** Automatically sets Urgency to High when Impact is High.
- **onSubmit Client Script:** Prevents saving when Assigned To is empty for a High-impact Incident.
- **onCellEdit Client Script:** Prevents State changes through direct list editing.

2.6 System & Testing Requirements

The project requires a working **ServiceNow instance**, appropriate configuration access, and the required Incident fields such as **Impact, Urgency, Assignment Group, Assigned To, and State**.

The configuration should be tested on both the **Incident form and Incident list**. Testing should confirm mandatory field enforcement, automatic Urgency updates, read-only behavior, save validation, reverse conditions, list-edit restrictions, and normal form-based updates.
